Portfolio Data Derivatives Disclosures

Market value figures reflect the trading value of the investments. Average Duration, Average Weighted Maturity and Average Coupon reflect certain derivatives held in the portfolio (or their underlying reference assets). Portfolio breakdown percentages may not total 100% and may be negative due to rounding, use of any derivatives, unsettled trades or other factors.

What are the Key Risks?

The value of shares in the fund and income received from it can go down as well as up and investors may not get back the full amount invested.

Performance may also be affected by currency fluctuations. Currency fluctuations may affect the value of overseas investments.

The Fund invests mainly in equity and debt securities of US companies. Such securities have historically been subject to significant price movements that may occur suddenly due to market or company-specific factors. As a result, the performance of the Fund can fluctuate considerably over time.

Investors should be aware that the fund's share price and yield will fluctuate with market conditions.

Counterparty Risk: the risk of failure of financial institutions or agents (when serving as a counterparty to financial contracts) to perform their obligations, whether due to insolvency, bankruptcy or other causes. Derivatives risk: the risk of loss in an instrument where a small change in the value of the underlying investment may have a larger impact on the value of such instrument. Derivatives may involve additional liquidity, credit and counterparty risks. Liquidity risk: the risk that arises when adverse market conditions affect the ability to sell assets when necessary. Reduced liquidity may have a negative impact on the price of the assets. Other significant risks include: lower-rated or non-investment grade securities risk, credit risk, derivative instruments risk, and interest rate securities risk.

For full details of all of the risks applicable to this Fund, please refer to the "Risk Factors" section of the Fund in the current prospectus of Franklin Floating Rate Fund Plc.

Glossary

Average Coupon: The average interest rate stated on the securities held by a portfolio.

Average Duration: A measure of the sensitivity of the price (the value of principal) of a fixed-income investment to a change in interest rates. Duration is expressed as a number of years. The weighted average duration of a fund reflects the effective duration of the underlying issues, based on the size of each holding.

Average Weighted Maturity: An estimate of the number of years to maturity, taking the possibility of early payments into account, for the underlying holdings.

Discount Margin: A yield measure reflecting the credit spread of a floating rate security. The Discount Margin represents the average spread over the London Interbank Offered Rate (LIBOR) that is expected to be received over the floating rate security's life.

Standard Deviation: A measure of the degree to which a fund's return varies from the average of its previous returns. The larger the standard deviation, the greater the likelihood (and risk) that a fund's performance will fluctuate from the average return.

Time to Reset: The average time to reset for the portfolio will be based on the average number of days in which the loans in the portfolio will adjust to the new rate based on the current LIBOR rate in the market.

Weighted Average Price: The average price of the securities held by a portfolio, excluding cash and collateralized debt obligations.
